

International  
Standard

**ISO 24384**

**Water quality — Determination of  
chromium(VI) and chromium(III)  
in water — Method using liquid  
chromatography with inductively  
coupled plasma mass spectrometry  
(LC-ICP-MS) after chelating  
pretreatment**

*Qualité de l'eau — Dosage du chrome (VI) et du chrome (III)  
dans l'eau — Méthode par spectrométrie de masse avec plasma à  
couplage inductif (LC-ICP-MS) après un prétraitement par agents  
de chélation*

## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO document should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see [www.iso.org/directives](http://www.iso.org/directives)).

ISO draws attention to the possibility that the implementation of this document may involve the use of (a) patent(s). ISO takes no position concerning the evidence, validity or applicability of any claimed patent rights in respect thereof. As of the date of publication of this document, ISO had not received notice of (a) patent(s) which may be required to implement this document. However, implementers are cautioned that this may not represent the latest information, which may be obtained from the patent database available at [www.iso.org/patents](http://www.iso.org/patents). ISO shall not be held responsible for identifying any or all such patent rights.

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see [www.iso.org/iso/foreword.html](http://www.iso.org/iso/foreword.html).

This document was prepared by Technical Committee ISO/TC 147, *Water quality*, Subcommittee SC 2, *Physical, chemical and biochemical methods*.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at [www.iso.org/members.html](http://www.iso.org/members.html).

## Introduction

Chromium (Cr) exists in natural resources and is also widely used in industries as plating agents, paints, dyes, catalysts, and dietary supplements. The Cr(VI) compounds are highly harmful and recognized to be a human carcinogen. The Cr(III) compounds are recently used as a substitute for Cr(VI) compounds in industries, e.g. plating. In wastewater, surface water, or drinking water, chromium mainly exists in two oxidation states: +3 [Cr(III)] and +6 [Cr(VI)]. However, the proportion between Cr(VI) and Cr(III) is quite variable. Therefore, the determination of the individual oxidation states of chromium is crucial to evaluate and control the risk of chromium to human and environmental health. This document will be beneficial to perform a robust, simple, and rapid determination of chromium of the individual oxidation states.
